## DIFFERENTIAL PRESSURE MEASUREMENT UNCERTAINTIES WITH TARE

The Tare function can improve measurement uncertainties on two modules with the same full scale pressure range installed into one nVision Reference Recorder. Requires the use of an equalizing valve.

The following specifications apply to the measurement system with a logging interval of 1 second/reading:

Full Scale Range of Both Sensors kg/cm <sup>2</sup>	The Greater of (+/-)				or	% of DP Reading
	mbar	psi	inH <sub>2</sub> O	mmH <sub>2</sub> O		
3	0.04	0.0005	0.014	0.4	or	0.025%
10	0.10	0.0015	0.04	1.0	or	0.025%
30	0.4	0.005	0.14	4.0	or	0.025%
100	1.0	0.02	0.4	10.0	or	0.05%
300	4.0	0.05	1.4	n/a	or	0.05%
700	10.0	0.2	4.0	n/a	or	0.1%
1000	15.0	0.3	6.0	n/a	or	0.1%

Unit must be enabled in CrystalControl

## DIFFERENTIAL PRESSURE MEASUREMENT UNCERTAINTIES WITHOUT TARE

The total nVision Reference Calibrator measurement uncertainty in the ΔP mode configuration will need to consider the uncertainties of both pressure modules. We recommend the module uncertainties to be combined with the preferred square root of the sum of the squares (or “root sum squares”) method.

The following table lists the possible combinations of using Pressure Modules (PM) with different accuracy statements. The uncertainties reported below are without the use of the Tare feature, which will greatly improve your measurement uncertainty.

		Upper Pressure Module Uncertainties (of Static Line Pressure) (of Reading)		
		0.025%	0.05%	0.10%
Lower Pressure Module Uncertainties (of Static Line Pressure) (of Reading)	0.025%	0.035%	0.056%	0.103%

## Temperature Module (RTD100)

Calibrated for Pt100 RTD/PRT (100 Ohms at 0°C Platinum Resistance Temperature Detector) sensors conforming to DIN/IEC 60751 (or IEC751) with US, Euro, or Lab calibration curves. An RTD is not included, but each RTD100 includes P/N 3953 RTD Connection Kit.

### TEMPERATURE MEASUREMENT

#### Resistance Input

Accuracy:  $\pm (0.015\% \text{ of rdg} + 0.02 \Omega)$

Range: **0 – 400 Ohms range for use with 100 Ohm PRTs**

Resolution: **0.01 on all scales**

Units: °C, K, °F, R,  $\Omega$

TCRs: **0.003850  $\Omega/\Omega/^\circ\text{C}$  (IEC 60751), 0.003911  $\Omega/\Omega/^\circ\text{C}$  (US Industrial Std), 0.003926  $\Omega/\Omega/^\circ\text{C}$**

Wiring: **2-, 3-, 4-wire support**

Connection: **M8 connector cable or terminal block**

*Includes all effects of linearity, hysteresis, repeatability, temperature, and stability for one year.*

The proper selection of the RTD sensing element is very important as the error associated with this device is the majority of the overall system measurement uncertainty. IEC 751 is the standard that defines the temperature versus resistance for 100 $\Omega$ , 0.00385  $\Omega/\Omega/^\circ\text{C}$  platinum RTDs. IEC 751 defines two classes of RTDs: Class A and B. Class A RTDs operate over the -200 to 630 $^\circ\text{C}$  range versus -200 to 800 $^\circ\text{C}$  for the Class B elements. For example, the Class A uncertainty is about half that of the Class B elements as illustrated in the following table.

Temperature °C	nVision Uncertainty		Class A				Class B			
			Class A Uncertainty		nVision + Class A Uncertainty		Class B Uncertainty		nVision + Class B Uncertainty
