Liquid, gas, and vapor applications

## Protocols

### 4–20 mA HART (Output Code A)

#### Output

Two-wire 4–20 mA, user-selectable for linear or square root output. Digital process variable superimposed on 4–20 mA signal, available to any host that conforms to the *HART* protocol.

#### Power Supply

External power supply required. Standard transmitter operates on 10.5 to 42.4 V dc with no load.

#### Turn-On Time

Performance within specifications less than 2.0 seconds after power is applied to the transmitter.

#### Load Limitations

Maximum loop resistance is determined by the voltage level of the external power supply, as described by:

$$\text{Maximum Loop Resistance} = 43.5 * (\text{Power Supply Voltage} - 10.5)$$

The HART communicator requires a minimum loop resistance of 250Ω for communication.

### FOUNDATION fieldbus (Output Code F)

#### Power Supply

External power supply required; transmitters operate on 9.0 to 32.0 V dc transmitter terminal voltage.

#### Current Draw

17.5 mA for all configurations (including LCD display option)

#### Turn-On Time

Performance within specifications less than 20.0 seconds after power is applied to the transmitter.

#### FOUNDATION fieldbus Function Block Execution Times

| Block             | Execution Time  |

## Failure Mode Alarm

If self-diagnostics detect a sensor or microprocessor failure, the analog signal is driven either high or low to alert the user. High or low failure mode is user-selectable with a jumper on the transmitter. The values to which the transmitter drives its output in failure mode depend on whether it is factory-configured to *standard* or *NAMUR-compliant* operation. The values for each are as follows:

| Standard Operation |                        |                           |                          |
|--------------------|------------------------|---------------------------|--------------------------|
| Output Code        | Linear Output          | Fail High                 | Fail Low                 |
| A                  | $3.9 \leq I \leq 20.8$ | $I \geq 21.75 \text{ mA}$ | $I \leq 3.75 \text{ mA}$ |
| M                  | $0.97 \leq V \leq 5.2$ | $V \geq 5.4 \text{ V}$    | $V \leq 0.95 \text{ V}$  |

| NAMUR-Compliant Operation |                        |                          |                         |
|---------------------------|------------------------|--------------------------|-------------------------|
| Output Code               | Linear Output          | Fail High                | Fail Low                |
| A                         | $3.8 \leq I \leq 20.5$ | $I \geq 22.5 \text{ mA}$ | $I \leq 3.6 \text{ mA}$ |

### Output Code F

If self-diagnostics detect a gross transmitter failure, that information gets passed as a status along with the process variable.
